

# SCL LIME REMOVER

SCL-Lime Remover is formulated to remove white salt weeping from the edge of the joints between stone. The white deposit is a build-up of salts. These salts are known in the tile industry as “lime putty” or “lime deposit” coming up from the setting bed. The salts will return and will need to be cleaned when this occurs. The white deposits on the surface are the result of no waterproofing membrane installation or poor installation practices.

SCL-Lime Remover is an acid-based cleaner but yet it gently dissolves the lime without eating into the stone; unlike other acid cleaners required to be very acidic to remove the lime. From our extensive research and experiences into stains analysis and stone care, the formulation of SCL-Lime Remover ensures that the cleaning effectiveness is maintained while bringing out the best from the stone.

## Application

No dilution, just pour and saturate the “lime putty” with SCL-Lime Remover for 15 to 25 minutes. When the lime is dissolved by the chemical, use a scraper gently scrape away the deposited lime.

**Remember** to rinse the stone with SCL-Stoneclean to neutralize the crystalline structure inside the stones.

**Preventive Measure:** regularly clean the affected area with Stoneclean will prevent the lime from depositing,

**Dilution:** mix 2 capfuls(40ml) of Stoneclean with one gallon (3.75 litres) of water.

SCL-STONECLEAN  
is a proven  
product to treat  
Efflorescence.
